Abundance

# Crack #1: Probes are Correlated

# Crack #2: Maybe Einstein was wrong

$$R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R \neq 8\pi GT_{\mu\nu}$$

Einstein was smart, and coming up  
with a better theory of gravity is hard

# Crack #2: Maybe Einstein was wrong

$$R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R \neq 8\pi GT_{\mu\nu}$$

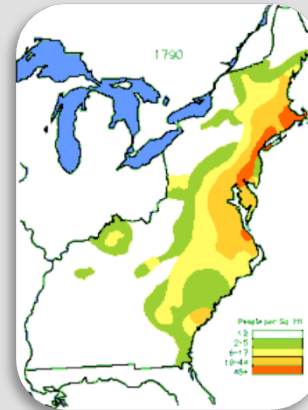

Einstein was smart, and coming up with a better theory of gravity is hard

## Modified Gravity vs. Dark Energy + GR

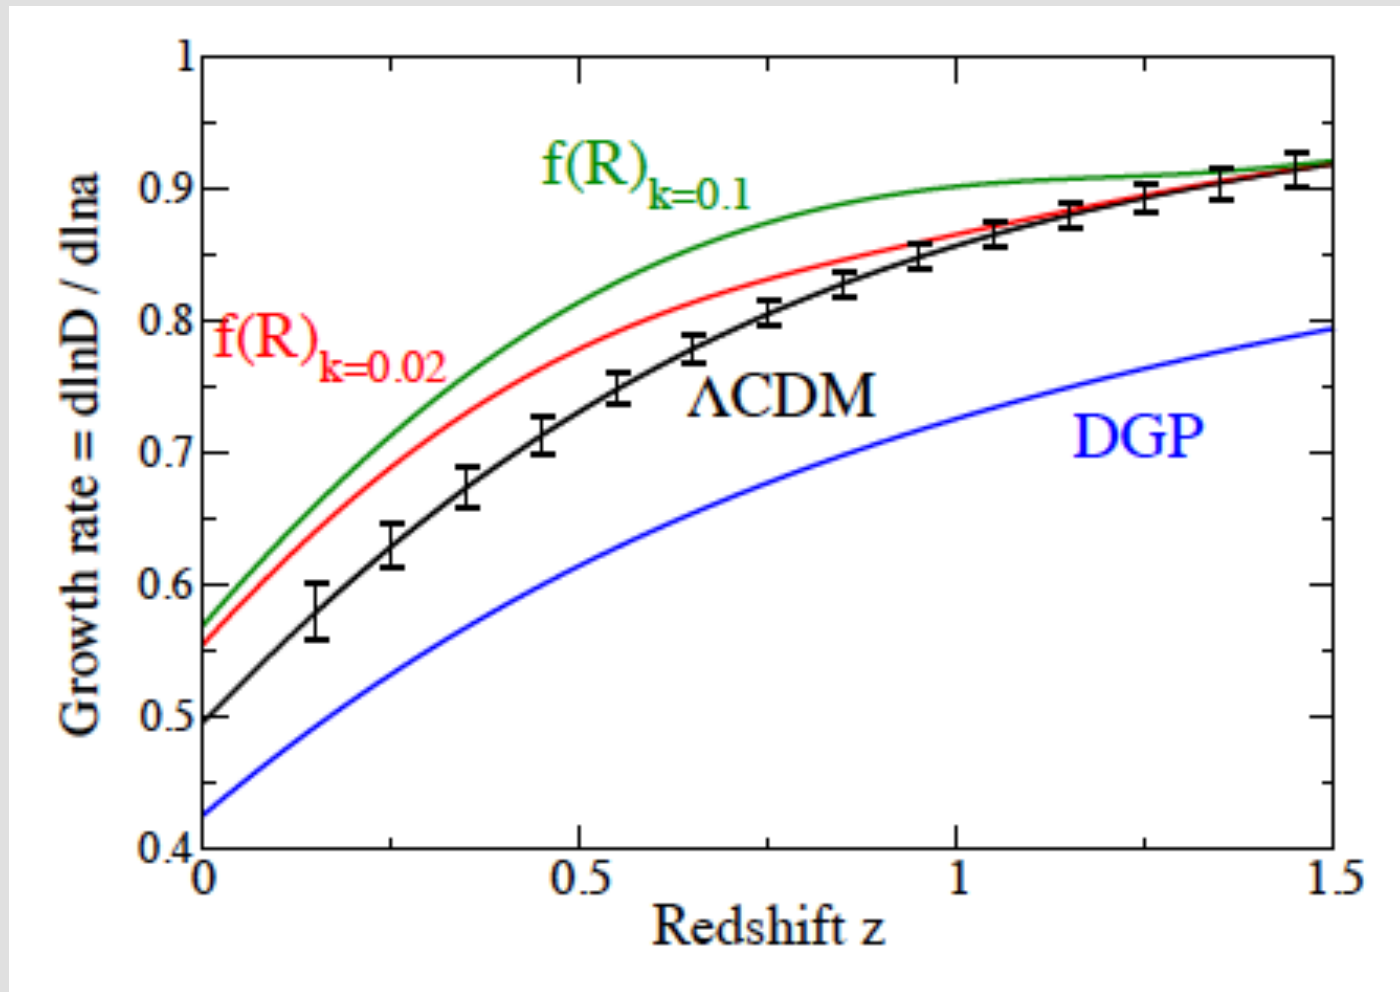

- New degrees of freedom
- MG models can postdict any expansion history
- With fixed expansion history, structure grows differently in the two classes of models

# Population of the U.S.

- Total population grew from 4M->310M
- Pattern of over- and under-regions grew in space and time
- If we understood all the **forces** – sociological, economic, racial, and political -- acting on the people ... we would be able to explain these patterns and this evolution

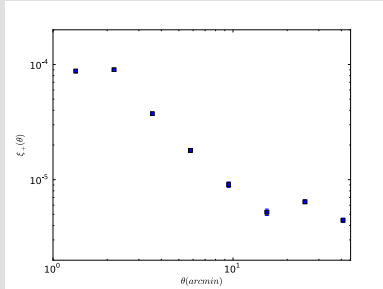

# Schematically: Fix Expansion History and Measure Growth of Structure

# More complicated in real life

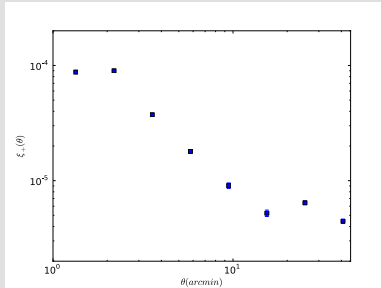

Data

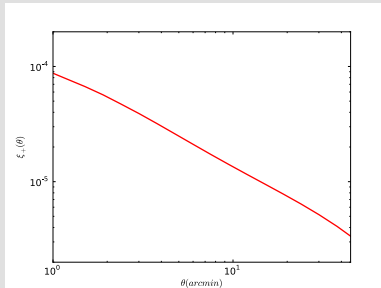

**BAO** and **SN** measure expansion history, but **Clusters** and **Lensing** sensitive to both expansion history and growth. All are correlated. Many different options for data vector.

# More complicated in real life

Data

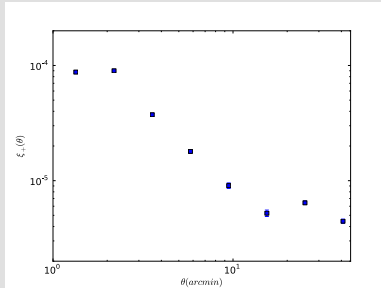

Theory

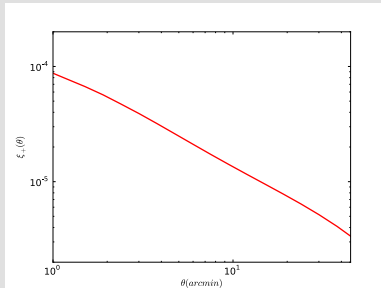

Can compute for Dark Energy model with  $(w, w')$  but many different MG models exist. Also need to include small scale modeling. Many different options for cosmological and nuisance parameters.

# More complicated in real life

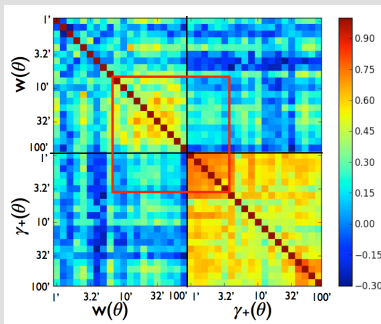

Data

Theory

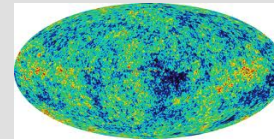

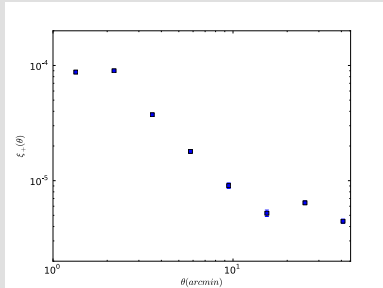

Covariance

Covariances depend on theory; require many simulations. Many different approaches even for fixed data vector, parameters

# More complicated in real life

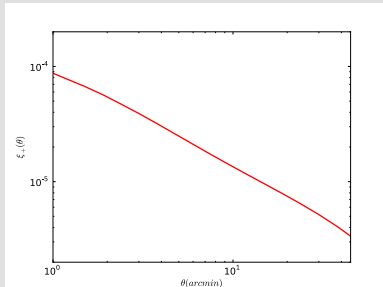

Data

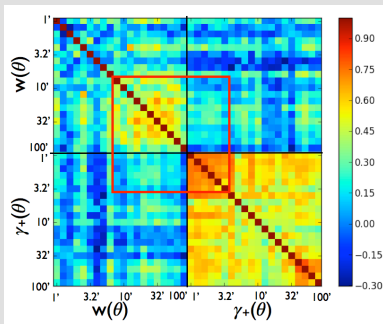

Priors

Will need to include priors from CMB and other experiments.  
Many different choices

Theory

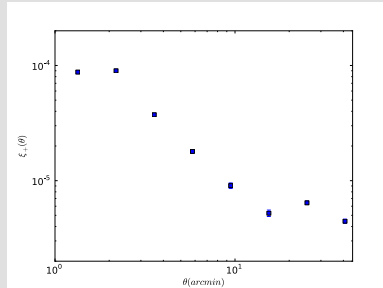

Covariance

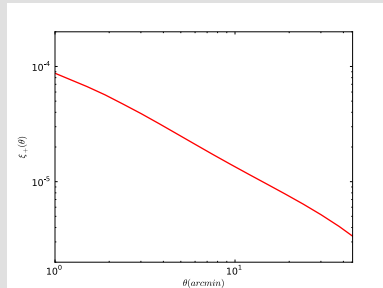

# More complicated in real life

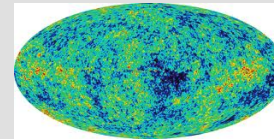

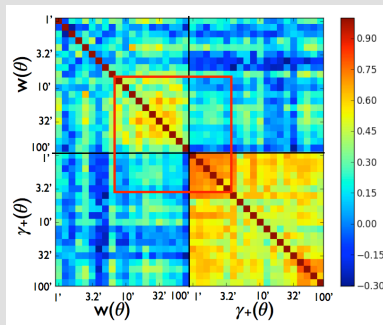

Data

Theory

Covariance

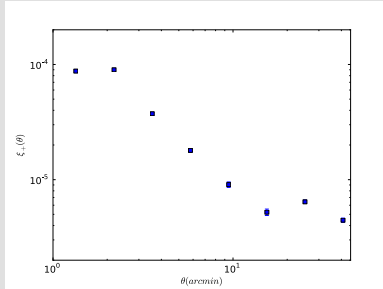

Priors

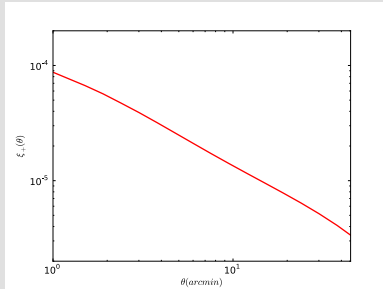

Need to sample many different points in multi-dimensional (could include hundreds of nuisance parameters) parameter space. Lots of options

Think of us as your younger sibling

# Some New Features

- Cosmosis-standard-library has contributions from other probes, experiments, etc.
- Can upload modules in multiple languages
- Credit for uploaded modules in “terms of use”
- Parallelism: natural to deploy and run on an HPC cluster

# Einstein-> Google

- Modified Gravity may explain acceleration
- Four traditional DE probes highly correlated
- Many ways of answering key physics questions: What is the nature of dark energy?  
Is it dark energy or modified gravity?
- CosmoSIS framework that will help thousands of scientists work on these questions together
